Diagnosis and Treatment of Dermatological Diseases

Message from the Guest Editor

The skin is the body's largest organ. Without the particular structure of our epidermis's very thin outer layer, we would not be able to live outside water. The skin is also a mirror of our own internal world. Blushing and stress-induced sweating, paleness, exaggerated pigmentation, icterus, and many infections are examples of the phenomena that may give a first hint towards undiagnosed internal diseases. Not only is the skin the most frequent site for benign and malignant tumours, but it may also signal the presence of an internal neoplasm. On the other hand, a genuine skin dermatosis may seriously impact many internal organs, as evidenced by the so-called metabolic syndrome observed more frequently in psoriasis. The skin is probably the most frequent organ to be affected by allergic reactions to endogenous and exogenous allergens, and allergies are increasing in prevalence and severity. This Special Issue welcomes both original and review scientific articles relating to the diagnosis and treatment of innumerable conditions, from cosmetic to life-threatening, that are able to interfere with the integrity of our skin.

Author Benefits

High Visibility:

indexed within Scopus, SCIE and SSCI (Web of Science), PubMed, PMC, and other databases.

Journal Rank:

JCR - Q2 (Health Policy and Services) / CiteScore - Q1
(Leadership and Management)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 21.5 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2025).
