Current Advances in Oral Health Promotion

Message from the Guest Editor

In these 30 years of practice, I have unfortunately seen many patients without teeth, bones, health knowledge, and financial resources. These factors do not contribute to the success of treatment based solely on professional qualification. Cavities and periodontitis are among the most common diseases in the human population. In advanced stages, they can lead to tooth loss and degradation of the alveolar bone, thereby compromising the function of the stomatognathic system. Additionally, these conditions may create infection sites that spread throughout the body, affecting overall health systemically. The adoption of preventive measures is essential for maintaining oral health and promoting a good quality of life at all stages of life. We are pleased to invite you to join us in building knowledge for the promotion of oral health. I look forward to receiving your contributions.
