Socio-Economic Burden, Gender and Country-Specific Differences Leading to Cardiovascular Diseases

Message from the Guest Editor

Cardiovascular diseases (CVDs) remain the leading cause of death globally, claiming millions of lives each year. While significant progress has been made in identifying and managing traditional risk factors like high blood pressure, cholesterol, and smoking, there is still much progress to be made in several areas. I am pleased to invite you to contribute to this field with novel findings by addressing these under-researched areas. We can gain a more holistic understanding of cardiovascular risk and develop more effective strategies to prevent and manage this global health challenge. It is time to move beyond a one-size-fits-all approach and tailor our efforts towards achieving SDG 3 and ensuring cardiovascular health for all. In this Special Issue, original research articles and reviews are both welcome. I look forward to receiving your contributions.
