Special Issue

Medical Care Services in Orthopedic and Musculoskeletal Trauma Care

Message from the Guest Editors

In the context of rehabilitation in trauma and orthopedics, outcome measures are frequently used to evaluate the characteristics of patients with musculoskeletal disorders in the context of hospital care and in clinical practice. These outcomes can provide important information for researchers who use these outcome measures, using clinical and/or preclinical research, as well as providing information in the literature for professionals for clinical practice. In the literature, a strong heterogeneity of tools and procedures used for the benefit of patients with any musculoskeletal disorder can be observed. Thus, this Special Issue seeks to emphasize research that addresses the care of orthopedic patients and pre- and post-surgical care due to trauma, with this approach being through observational research and clinical trials, and will be an important path towards bringing highquality studies to the area of orthopedics and traumatology. Therefore, we are pleased to invite you to provide clinicians and researchers with studies that strengthen the evidence for an appropriate, literaturebased approach to improving care for patients with musculoskeletal system impairment.
