Current and Future Directions in the Prevention and Treatment of HPV-Related Diseases

Message from the Guest Editors

Human papillomavirus (HPV) infection represents one of the major causes of infection-related cancer both in women and men. The high burden of HPV-related diseases highlights the need to implement preventive and diagnostic measures. Primary and secondary prevention strategies, such as HPV vaccination and screening, have been introduced in recent decades, leading to important reductions in cervical cancer cases and mortality. However, effective measures are scant for other HPV-related diseases. On this basis, we are pleased to invite you to submit your research work and reviews that will be supportive in the development of new methodologies for diagnosis and prevention of HPV-associated diseases. Meta-analysis and systematic reviews of existing effective preventive tools, along with clinical trials and observational studies, are welcome. We will appreciate any contributions that address relevant issues in the field of prevention, early detection, screening, and treatment of HPV infections. We look forward to receiving your contributions.
