Digital Health: Intervention and Monitoring in Oral Health

Message from the Guest Editors

Recent years have seen an increased use of digital technologies as an aid in dental therapies. Some important technological developments have also arrived in the field of telemedicine and were distributed widely by the COVID-19 pandemic, which required an increase of the remote monitoring of patients' health status. Regarding teledentistry, some appliances allow a continuous remote monitoring of the oral health status, reducing the need of a direct control in the dental office. The aim of the present Special Issue is to promote a development of the scientific literature in order to give a complete perspective of the positive and negative aspects of the digital revolution, as well as an idea of the precision and reliability of these techniques. Original manuscripts with scientific relevance in the form of original research articles, reviews or high-quality case reports on new techniques or clinical solutions are accepted for submission.
