New Insight into Female Genital Tract Healthcare in the Era of Climate Changes: Focus on Infertility

Message from the Guest Editor

Human Infertility has been defined by WHO as a new “pandemic” worldwide. Climate changes and chemical pollutants are dramatically contributing to the decline of both male and female potential to conceive. This scenario represents a tangible threat to the human species, which needs to be tackled by orchestrated global strategies including climate policies (as preventive measures) and tailored medical interventions (as treatment measures). Given this premise, the aim of the present Special Issue is to respond to the unsolved questions concerning human infertility and the relationship between its multiple contributing factors with male and female genital and extragenital apparatus.
