

## Special Issue

# Rehabilitation and Treatment of Spinal Cord Injuries

### Message from the Guest Editor

Spinal cord injury (SCI) is one of the most debilitating conditions. It causes biophysical, psychosocial and economic problems. The treatment of patients with SCI is an ongoing process lasting many years, starting shortly after the injury with intensive care and early surgical interventions and ending with rehabilitation, which takes many years. At the same time, many problems involving other organs can occur, such as pressure ulcers, spasticity with contractures, and bladder and bowel problems. Patients with spinal cord injury often require care from multiple specialists, delaying a patient's reintegration with society and leading to psychosocial distress. This Special Issue seeks empirical and practical studies that consider treatment but especially rehabilitation in relation to SCI on the topics including, but not limited to, the following:

- Acute, subacute and chronic rehabilitation in SCI.
- Psychosocial aspects of these diseases.
- Aspects of complications and their treatment in the context of SCI; for example, bladder and bowel issues, pain problems, etc.
- Nutritional aspects.
- Others.
