Special Issue

Mental Health and Coping During COVID-19

Message from the Guest Editor

The COVID-19 pandemic has most likely impacted the mental health and wellbeing of the general population as well as the organisations providing mental health services across the world in various ways. It is very likely that the mental health impact of the COVID-19 pandemic will be seen through an increased prevalence of a number of mental health conditions. In addition, there is a probability that the incidence of other mental health problems might increase. All these events have the potential to contribute to another pandemic—one of mental health problems. Due to the rapid increase in mental health problems and increased pressure on mental health services, we might need to rethink and modify how we address mental health and coping for the general population and healthcare providers. For this Special Issue, we welcome original studies carried out on the worldwide impact of COVID-19 on mental health and coping, in various contexts including responses from mental health professionals. In addition, studies looking at health behaviour and the psychological impact that can help improve clinical practice will be most welcomed.
