

Special Issue

Aging and Quality of Life: Second Edition

Message from the Guest Editor

Aging is a social issue in some countries. This is because aging brings increased medical and long-term care costs and social losses due to informal care. The most common diseases that increase with age are cardiovascular disease, cerebrovascular disease, cancer, diabetes, orthopedic diseases and Alzheimer's disease. Although treatments for these diseases have been developed, they cannot completely prevent or cure the onset of these diseases. It is necessary to prevent the onset of these diseases that tend to occur with aging, and to provide treatment and social systems that support such prevention and treatment so that people can return to their normal state as much as possible after the onset of these diseases. We welcome the results of scientific research on these topics.

The purpose of this Special Issue is to consolidate the latest findings on age-related diseases and their treatment and healthcare systems. Rehabilitation will play an important role in treating age-related diseases, while healthcare systems will include prevention and prophylactic programs. It is also important to clarify the effects of aging from the perspective of the quality of life.
