Urological Cancer Care— Improving Patient Outcomes

Message from the Guest Editor

This Special Issue aims to collect research works highlighting the meaning of “Urological Cancer Care—Improving Patients’ Outcomes”. There is increasing evidence that surgery and medication in urological cancer treatment have rapidly progressed in recent years. New technology plus target and immunotherapy have ushered in a new era for urological cancer treatment. However, the urological cancer care system has not kept pace with that progress. One-size-fits-all approaches to patient care are rarely successful, particularly when it comes to cancer treatment. Cancer care is strongly associated with cancer outcomes. As such, patients with urological cancers should be managed by a multidisciplinary and collaborative urological cancer care team to keep up with current management steps. Specific themes we would like to address include but are not limited to the following list:

- Post-operation care;
- Urological cancer patient centered care;
- Supportive and palliative care;
- Collaborative care system;
- Model systems for personalized medicine in urological cancer care.
