Symptoms and Experiences of Patients after Intensive Care

Message from the Guest Editors

After staying in intensive care, many patients experience symptoms known as Post-Intensive Care Syndrome (PICS). PICS primarily includes mental health problems and cognitive and physical impairments. These symptoms can potentially deteriorate quality of life and make employment difficult. These are important issues that need to be solved; however, effective prevention and treatment methods have not yet been established. The purpose of this Special Issue is to solicit and discuss research and review articles on PICS, as well as a wide range of related topics, including experiences such as insomnia, effects on daily life, and employment status after an intensive care stay.
