

# Special Issue

## Genetic Resources for Viticulture

### Message from the Guest Editors

Grapevine (*Vitis vinifera* L.) is one of the most widely cultivated and economically valuable horticultural crops in the world. Research on autochthonous or local grape cultivars, clonal selection and the development of new variety has been, and continues to be, the basis of numerous research projects aimed to provide answers to the problems faced by the wine industry. For this reason, in this Special Issue, we would like to include studies related to the identification and agronomic, physiological and oenological characterization of new and local grapevine varieties, rootstocks, clones and interspecific hybrids as sources of genetic resources to meet the challenges of viticulture.

## About the Journal

### Message from the Editor-in-Chief

Horticultural plants and their products provide sustenance, health, and beauty. A confluence of factors is putting increasing pressure on horticultural production to evolve, and innovative research is addressing these challenges. *Horticulturae* provides a venue to communicate research results in a rapid manner with open access, allowing everyone the opportunity to stay abreast of leading research addressing horticulture. I invite you to consider publishing the results of your research in this high quality, peer-reviewed journal.
