Special Issue

Theoretical and Practical Aspects of Hydrogen Production from Hydrocarbons

Message from the Guest Editors

This Special Issue addresses the main aspects of hydrogen production from hydrocarbon sources. One of the cost-effective and energy efficient technologies of hydrogen production is steam reforming of methane and other light olefins. The outlet gas stream contains hydrogen, carbon monoxide, and carbon dioxide. On the other hand, the processes of thermal and catalytic pyrolysis of hydrocarbons allow obtaining hydrogen without the emission of carbon dioxide. The only side product here is carbon in the form of nanostructured materials (nanotubes, nanofibers, etc.). Catalytic dehydrogenation of olefins gives alkenes, which are highly demanded monomers for the polymer industry, and pure hydrogen. Another issue connected to the mentioned topics is hydrogen purification (separation from the outlet reaction mixture) using various adsorption and membrane techniques. Both applied and theoretical works are welcome for this Special Issue, including process modeling and reactor design. Research aiming to produce novel catalysts and adsorbents for the mentioned processes is welcome as well.

2. Institute of Materials Research, Helmholtz-Zentrum Geesthacht, Centre for Materials and Coastal Research GmbH, Max-Planck-Str. 1, D-21502 Geesthacht, Germany

Author Benefits

High Visibility:

indexed within ESCI (Web of Science), Scopus, Ei Compendex, CAPlus / SciFinder, and other databases.

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 17.6 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the first half of 2025).

Journal Rank:

CiteScore - Q1 (Engineering (miscellaneous))
