

## Special Issue

# Oral Hygiene and Oral Health: Now More Connected Than Ever

### Message from the Guest Editors

During the pandemic, oral health has become a worldwide concern reaching systemic status.

Now, more than ever, professionals from several different medical fields are cooperating in order to provide prompt answers to increasing doubts about global wellness.

This Special Issue endeavors to collect manuscripts based on dental experience, systematic and narrative reviews of established techniques, surveys but also original articles and case reports that can support a different point of view about oral medicine, dental hygiene, systemic health and upcoming relations with COVID-19. The aim of this Special Issue is to provide a study of the state-of-the-art of the problem and a starting point for future research. In light of this, articles addressing these topics are invited to this Special Issue.

## About the Journal

### Message from the Editor-in-Chief

The global burden of healthcare-associated infections remains an issue. The increase in the incidence of antibiotic resistance may result in the development of novel concepts to control the transmission of multi-resistant pathogens in various fields. Antiseptic tolerance towards some biocidal agents used for disinfection is being found more and more in selected bacterial species. It is therefore important to carefully balance the expected health benefits of specific hygiene measures against the likely risks and consequences associated with their implementation. I very much hope that this journal can contribute substantial knowledge on the various different aspects of hygiene. The Editorial Board Members and myself cordially invite you to share your latest findings by submitting original research and review articles as well as proposals for Special Issues.
