Message from the Guest Editor

The clinical situation induced by Sars-CoV-2 in various target organs has been extensively studied and described. Long COVID syndrome is widely analyzed in the literature, and guidelines have been produced by the world's leading scientific institutions.

Scientific evidence concerning the oral cavity is relatively insufficient, but involvement in COVID-19 pathology is established. Moreover, a significant proportion of patients following a SARS-CoV-2 infection may present with persistent symptoms in the oral cavity.

Specifically, the cells comprising the oral cavity express the viral entry receptor, angiotensin-converting enzyme 2, which allows replication and can cause inflammation and tissue destruction.

Furthermore, elevated levels of pro-inflammatory mediators in patients with COVID-19 and oral infectious disease may impair tissue homeostasis and cause delayed disease resolution. This suggests the potential crosstalk of immune-mediated pathways underlying pathogenesis.

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, PubMed, MEDLINE, PMC, Embase, GEOBASE, CAPlus / SciFinder, and other databases.

Journal Rank: CiteScore - Q1 (*Public Health, Environmental and Occupational Health*)
