Message from the Guest Editor

Among children, adolescents, and adults, the prevalence of physical inactivity is high. Studies that present trends of physical activity over the last few decades have shown that physical activity levels are not increasing. This is concerning because low levels of physical activity jeopardize the population's health status.

In order to increase the levels of physical activity and consequently improve health status, population-wide strategies are needed to change behavior. A seemingly easy way to increase the population's levels of physical activity is through active transportation. Active commuting and active transportation on foot or by bicycle create opportunities for physical activity, provide transportation options for those without a car, encourage social cohesion, and reduce contributions to air pollution. Therefore, it is important to know the prevalence of the use of active transportation, as well as strategies for its promotion.

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, PubMed, MEDLINE, PMC, Embase, GEOBASE, CAPlus / SciFinder, and other databases.

Journal Rank: CiteScore - Q1 (Public Health, Environmental and Occupational Health)
