

Special Issue

Environmental Influences on the Psychosocial Outcomes of Children, Adolescents and Young Adults

Message from the Guest Editors

The impact of physical built environment on physical health is well-established, though little research has focused on its role in mental wellbeing. In particular, studies of children, adolescents, and young people in the community and the impacts of built environment on their health are not often studied. Developmentally, this area of research is important in informing public health policy when designing healthy indoor and outdoor built environments for youths to maximise their psychological health outcomes. This special issue invites high quality contributions from researchers examining a broad range of physical and virtual built environment and the associated psychological wellbeing indicators. Examples of environment include physical environments, neighbourhood characteristics, air pollution, noise, green space, blue space, virtual space, urbanicity, transportation system, built environment, indoor and outdoor, household.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
