Socio-Environmental Health and Risk Perception

Message from the Guest Editors

Socio-environmental health corresponds to the integrated phenomenon between societies and natural environments. This integration process occurs in different human contexts (un)sustainable conditions of healthy states (or not) are generated; these conditions result from work processes. The complex production of socio-environmental health incorporates the perception of risk conducted by risk communication (producing and reproducing knowledge combined with decision-making) to predict, prevent, and eliminate dangers to socio-environmental health in the sense of promoting healthy conditions of life. According to WHO, healthier environments can prevent nearly a quarter of the global disease burden. The COVID-19 pandemic is representative of socio-environmental inequities in the sensitive relationship between people and the planet. Thus, when socio-environmental health is assumed, with any perspective on different objects of investigation, we have an immense responsibility to know and act to protect ourselves and others of the same nature and different natures.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
