Spatial and Spatiotemporal Epidemiology of HIV/AIDS Prevalence

Message from the Guest Editor

Spatial and spatiotemporal epidemiology consist of the study of the prevalence, incidence, distribution and pattern of a particular health outcome over a given time and space. Spatial and spatiotemporal epidemiology of HIV/AIDS prevalence, incidence, distribution and patterns play a critical role in understanding the HIV/AIDS epidemic, its surveillance and the development of preventive measures across the world, especially in developing countries where the prevalence and incidence of HIV/AIDS are higher. This Special Issue focuses on the spatial and spatiotemporal epidemiology of HIV/AIDS prevalence and its associates. It is therefore anticipated that this Special Issue will provide a conducive environment for scientists, researchers, academics and other professionals to showcase advances in the spatial and spatiotemporal epidemiology of HIV/AIDS prevalence, incidence, distributions and patterns. This will promote future research in the growing fields of spatial epidemiology and spatiotemporal analysis of health outcome. Therefore, contributions of original and high-quality research papers are invited.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
