Refugee Health and Well-Being: Psychological, Behavioral and Biochemical Insights

Message from the Guest Editor

At present, forcible displacement and unavoidable migration have resulted in nearly 80 million displaced people, 26 million of whom are refugees. This is the highest since the second World War broke out. Conflict, instability and civil war in Sub-Saharan and West African countries, conflict in Syria, war on terror in Afghanistan, the Rwanda and Rohingya genocide and more recently the crisis in Ukraine have resulted in massive displacement of men, women and children from their home countries. The traumatic experiences of war and conflict and ethnic, cultural and socioeconomic complexities, combined with the struggles of resettlement, make refugees highly susceptible to several health risks such as obesity, diabetes, mental health (including depression and post-traumatic stress disorder), tuberculosis, nutritional deficiencies, parasitic infections, chronic hepatitis B infection, cancer, etc. To better understand the health risks and examine the structural health disparities faced by refugees, psychological, behavioral and basic science research is critical in understanding these important aspects.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
