Adverse Childhood Experiences Impact on Health Outcomes

Message from the Guest Editors

Adverse childhood experiences (ACEs) have been associated with deleterious consequences throughout the lifespan of the individual, including an increased risk of mental disorders and the emergence of chronic diseases. However, an in-depth understanding of ACEs in diverse populations, how ACEs should be best measured, and the short-term (especially during the COVID-19 pandemic) and long-term impacts on the cognition and neurological and physiological development of individuals is still lacking. There are also growing number of studies assessing the economic burden of ACEs at the individual, caregiver and national levels, which need further attention from relevant stakeholders. In this Special Issue of *International Journal of Environmental Research and Public Health* (IJERPH), research addressing these topics is invited. We welcome new studies and review papers from different disciplines, including implementation science, epidemiology, psychology, health economic and intervention studies to address these topics. Keywords

- adverse childhood experiences

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
