HIV Care Across the Life Course: Challenges While Aging with HIV

Message from the Guest Editor

The success of antiretroviral therapy has transformed HIV into a manageable chronic condition, leading to a rapidly growing population of people aging with HIV worldwide. As life expectancy increases, new and complex challenges have emerged across the life course. These challenges often intersect with long-term treatment exposure, socioeconomic inequities and health system fragmentation, placing individuals living with HIV, including growing-up adolescents and young adults with perinatal HIV and older adults who survived with HIV, at increased risk for adverse health outcomes. Addressing HIV care while aging, therefore, requires a life-course perspective that integrates clinical, behavioral and social dimensions of health and that adapts care models to the evolving needs of individuals over time.

We invite researchers, clinicians, and public health practitioners to contribute original research, reviews, and implementation studies from diverse global settings that examine innovative models of care, identify service gaps, and inform policies that support healthy aging among people living with HIV.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
