

Special Issue

Areas at Risk of Unfavorable Hydrometeorological and Health Conditions

Message from the Guest Editors

Society is exposed to numerous consequences due to the changes in the environment. As a result of these changes, there are a number of processes that directly or indirectly threaten the life and health of the population. Of particular importance are extreme hydrometeorological phenomena, the effects of which are felt in various regions of the world. These include floods, droughts, hot days, torrential rainfall and strong winds. The problem of the impact of changes in hydrometeorological phenomena has been widely discussed in the literature, especially for areas where conditions are unfavorable or where large areas were affected. Increasingly, unfavorable hydrometeorological phenomena are affecting small areas in the temperate climate zone, which contribute to the deterioration of the living conditions of the population. In this Special Issue, we want to draw more attention to the problem of changes in hydrometeorological conditions in connection with changes and health threats (including suicide) in local terms, and the possibilities of adapting to these changes.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul B. Tchounwou

RCMI Center for Urban Health Disparities Research and Innovation,
Richard N. Dixon Research Center, Morgan State University, Baltimore,
