Focusing on the Cognitive Component of Subjective Well-Being: The Relationship between Life Satisfaction and Psychological Distress

Message from the Guest Editors

Research is pointing to an alarming increase in mental health problems, largely exacerbated by the COVID-19 pandemic. Being satisfied with one's life and promoting satisfaction with life hold potential for countering the adverse effects of the negative indices of psychological distress. Life satisfaction is regarded as the cognitive component of subjective well-being. In the context of the growing mental health "pandemic", the correlating and protective factors of the negative indices of mental health should be considered as a priority. Life satisfaction is an important pillar within the positive psychology movement (Seligman and Csikszentmihalyi, 2014) and focuses on psychological strength. This Special Issue calls for papers that focus on the relationship between life satisfaction and indices of psychological distress, as well as the potential protective roles that life satisfaction plays with regard to the negative indices of mental well-being in different populations.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
