The Association between Family Relationships and Psychological Health

Message from the Guest Editors

The fundamental role of family in the psychological health of family members across the life course has been well-established in the scientific and clinical literature. However, there is still a need to better understand the complexities of family relationships with greater attention paid to diverse family relationships/structures. In this Special Issue, we are particularly interested in original or review articles exploring novel/understudied aspects of family relationships, psychological health, or the association between them. In particular, we welcome research focusing on the primary pathways and processes through which family relationships influence family members' psychological health, namely under challenging circumstances. Likewise, focus on diverse family relationships (e.g., marital relationships; intergenerational relationships; sibling relationships, parenting-related processes; family adversities and resilience; family structures; or family assessment measures) is appreciated. We use broad definitions of psychological health and well-being, as well as psychopathology, as indicators.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul R. Ward
