

Special Issue

Systemic Conditions, Oral Health and Quality of Life of Pregnant Women

Message from the Guest Editor

Pregnancy causes physiological, hormonal, and dietary changes which can increase the risk of oral diseases, such as periodontal disease, dental wear, and dental caries. Some studies have already reported the negative impact of oral diseases on the oral related quality of life (OHRQoL) and perceptions of wellbeing. In addition, insufficient oral health care during pregnancy might have negative outcomes for both mothers and their newborns. Therefore, improving oral health and strengthening oral care are important measures to improve the general health and maintain overall quality of life in pregnant women. At present, the number of oral-health-related studies on pregnant women is limited. This Special Issue aims to address the importance of oral health for pregnant women and the barriers that prevent pregnant women from seeking oral health care, to develop effective interventions based on a full understanding of this problem, so as to improve maternal oral health, quality of life, and wellbeing.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul B. Tchounwou
