

Special Issue

Built Environment and Public Health: Land Use, Neighborhoods, and Housing

Message from the Guest Editors

The built environment is a social determinant of health and plays a critical role in public health and quality of life. Understanding the connections between the built environment and public health is therefore critical for designing and implementing upstream and population-level interventions that target disease and injury.

Analyzing this link remains promising for both research and practice. This Special Issue invites research articles that utilize different methodologies to explore these relationships from various angles and in different contexts. Research articles should be grounded in existing knowledge and aim to further our understanding of these connections. This issue also invites practice-oriented papers that detail programmatic and policy interventions centered on land use, neighborhoods, or housing and public health. Practice-oriented papers should include descriptive components and should also be grounded in theory and/or research. They should also be analytical; they should highlight the lessons learned that may be of value in research and practice.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
