Comprehensive Assessment of Children's Oral Health: Evaluating Knowledge, Attitudes, and Practices

Message from the Guest Editor

Dental caries is a significant public health problem worldwide and affects all age groups, especially children. The acquisition of consistent behaviors in childhood begins at home, with parents playing an essential role in a child's attitude toward oral health; therefore, it is important to emphasize that parents and caregivers should be informed that their dental habits affect children's oral health and, in turn, their quality of life. Furthermore, according to the World Health Organization, health education is essential for improving individuals' health behaviors through learning and experience. Hence, the goal of oral health education is to increase the knowledge of all those involved in a child's upbringing and education to acquire good behaviors, attitudes, and skills that contribute to better oral health. This Special Issue aims to highlight the importance of education in maintaining oral health and acquiring good oral habits as well as practices in children, which will consequently lead to the preservation and improvement of their oral health. We invite researchers to submit original and review articles.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
