Effects of COVID-19 on Public Health, Social Science, and Human Behaviors

Message from the Guest Editors

The coronavirus disease 2019 (COVID-19) is a pandemic event that has changed our nations, society, health, education, and human behavior. National policies to prevent the spread of the COVID-19 have a significant impact on individuals' social behaviors. There are substantial changes in the various social activities of an individual, such as reducing economic and religious activities, social distancing, delaying school, staying at home, and so on. In order to ensure the well-being and safe life of human beings from any sort of epidemic diseases, epidemiological studies are required to identify the limitations of the existing public health systems and human behaviors, and to suggest future guidelines. This Special Issue aims to analyze the impacts of COVID-19 on public health systems and human behavior patterns, and to suggest future behavioral guidelines for general populations. The manuscript should be designed based on quantitative or qualitative data analyzing the situation. In addition, it is recommended that authors use various machine learning techniques to model the characteristics of human behavioral or patient data.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
