# Impacts of Socioeconomic Status on Inequities in Cardiovascular Disease and Risk Factors

# Message from the Guest Editors

Cardiovascular disease (CVD) is one of the leading causes of death globally and stark disparities in mortality rates and incidence are observed by particular demographic groups. For example, in the U.S., the CVD death rate among non-Hispanic blacks in the U.S. is 33% higher than the national average, and racial disparities in risk factors like diabetes, hypertension, and obesity have persisted over time. Gender differences in many societies exist, as do geographic differences in CVD mortality rates and the prevalence of risk factors. Socioeconomic status (SES) is a major contributor to these disparities, which impacts CVD in complex ways across contexts. For this Special Issue, we invite the submission of papers on how SES can impact inequities in CVD and related risk factors. Inequities can be based on gender, race, ethnicity, geography, and other social vulnerabilities. We welcome studies that use a variety of analytical approaches ranging from spatial statistical methods to qualitative data analyses, and studies with social justice implications. We welcome contributions across fields including public health, social work, social science, medicine, and law.

# **About the Journal**

# Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers.

Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

*IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
