

Special Issue

Improving Quality of Care for Women and Newborns

Message from the Guest Editors

The results of professional interventions must be evaluated globally, considering the improvement of patients' health, efficient use of available resources, and patients' satisfaction. It is well known that in situations where the needs and demands of the patients do not fit the biomedical model of disease, as frequently occurs in some obstetric and gynecological conditions, the relationship between healthcare providers and patients may become more difficult, and the quality-of-care parameters might be affected. In this regard, issues regarding obstetric care, perinatal mental health, and all the needs and demands of childbearing women, the clinical management of chronic pelvic floor pain, endometriosis, sexual disorders, or gynecological functional pathology frequently overcome the biomedical model, and a biopsychosocial approach has been claimed. This Special Issue welcomes new protocols, novel treatments, and all proposals aimed at improving the quality of women and newborns' care.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
