Special Issue

Cognitive Assessment after Brain Injury

Message from the Guest Editor

Cognitive impairment following brain injury is a leading cause of disability worldwide. Accurate cognitive assessment is extremely important: not only does it enable clinical care by identifying rehabilitation needs and by evaluating response to treatments in individual patients, but it also empowers research examining the impact of brain injury or the effect of new interventions. Common problems following brain injury, such as fatigue, pain, mood disturbance, motor or communication difficulties can present considerable barriers to cognitive assessment. Additionally, assessment can also be influenced by linguistic, socioeconomic and cultural factors.

Papers addressing these problems are invited for this Special Issue. Topics of particular interest include innovative cognitive assessments designed for specific brain injury populations such as traumatic brain injury or hypoxic-ischaemic brain injury following cardiac arrest, computerised cognitive tasks suitable for remote deployment online, gamification, patient engagement, longitudinal assessment, validation, cost, feasibility and accessibility aspects, especially in low-income or culturally diverse settings.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers.

Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
