Dental Care for Elderly and Special Groups

Message from the Guest Editors

Oral diseases are common in the elderly population which can lead to pain, tooth loss, disfigurement, poor chewing efficiency, and reduced life quality. Dental and oral health conditions in the elders are often compromised by their underlying chronic health problems. Notwithstanding this, therapeutic treatment of chronic diseases and over-the-counter medications can lead to reduction in salivary flow that further complicates oral health and puts elders under high risk of caries and oral mucosal infections. Similarly, dental treatments for people who have special needs and demand special care often pose great challenges to dentists. Dental care programs designed for the elderly and special groups which aim at disease prevention, replacement of tissue loss, and restoration of function should take into account their health conditions and capabilities of self-care.

This Special Issue welcomes studies and reviews on dental care for elderly and special groups. Links of oral health and general health, development of treatment approaches, evaluation of treatment, and dental care programs for elders and special groups are also within the scope of this issue.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
