Evidence-Based Practice in Nursing

Message from the Guest Editor

Evidence-based practice (EBP) is an important tool in improving healthcare quality and patient outcomes, while also reducing the overall cost of care. It involves forming a clinical question to identify a problem, gathering the best evidence, analyzing the evidence, applying the evidence to clinical practice, and assessing the result. It can provide health workers with the scientific research to make well-founded decisions, and help them pinpoint care strategies that can help their patients. It helps ultimately to improve the public health, which is high in our concerns. This Special Issue aims to provide a venue for networking and communication with scholars and health workers, in order to help bridge the gap between research-generated evidence and clinical nursing practice and education. We welcome original articles, review papers, communications, brief reports, case reports, etc. All papers will be published with fully open access after peer review.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul B. Tchounwou
