

Special Issue

Environmental Factors and Gastrointestinal Cancers

Message from the Guest Editor

Gastrointestinal (GI) cancers include 26% of the cancer incidence and 35% of all cancer mortality worldwide. The World Health Organization (WHO) estimated that about 20% of cancer mortality is due to environmental factors. Therefore, we could prevent these types of cancer by controlling these factors. Many environmental factors have been proposed in cancer development including habits; dietary factors; food contamination with toxins; chemical carcinogens; medications; and geographic factors; However, GI cancers are still a challenge to public health. Cancer prevention requires an understanding of the role of environmental factors in carcinogenesis and cancer progression. In this special issue of the International Journal of Environmental Research and Public Health (IJERPH) we accept manuscripts evaluating the association between environmental factors and GI cancers. Original papers, review papers and meta-analyses, case reports, and case series are welcome. We will accept manuscripts about different types of GI cancers including cancers of the esophagus, stomach, pancreas, gallbladder, liver, small intestine, appendix, colon, rectum, and anus.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
