Special Issue

Environmental Policy and Governance Performance

Message from the Guest Editors

With the world's economic growth, rapid industrialization and urbanization have led to more and more serious climate change and environmental pollution. The remarkable achievements in economic development have caused countries to discharge a large number of carbon emissions and environmental pollutants. Excessive emissions of CO2 cause the greenhouse effect, which in turn leads to climate change. Faced with the discharge of CO2 and environmental pollutants and their harm, a real problem that needs to be solved is: how can various environmental protection regulations effectively control the discharge of carbon emissions and environmental pollutants? So far, developed and developing countries have established multiparticipation environmental policy systems, including command-and-control policies, economic incentive policies, and public participation policies. It is of important theoretical value and practical significance to explore various environmental policies for the governance performance of the economy, society, environment, and health. This Special Issue focuses on the current state of knowledge on the links between environmental policy and governance performance.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers.

Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
