Risks to Human Health Caused by Exposure to Wastewater Contaminated with Metals and Microplastics

Message from the Guest Editor

Water, as a vital resource for maintaining life, is essential in maintaining the homeostasis of organisms. The quality of this resource is essential to public health and the survival of organisms. We will address several types of problems related to water contamination, such as waterborne infections, diarrhea, vomiting, hepatitis, leptospirosis, and contamination of the trophic chain by heavy metals, among others. Furthermore, we must take into consideration studies that demonstrate the synergistic processes of contaminating agents. Chronic exposure to contaminated water can result in severe public health problems.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
