Gender Differences in Emotions, Cognition, and Behavior

Message from the Guest Editor

The concept of gender distinction, which was proposed in 1972 by the English sociologist Anne Oakley, refers to a complex interrelation between psychological and cultural behaviors (due to ethnical, social, and religious backgrounds) and male/female sexual differentiation (as a biological and functional marker of the human body). Gender medicine is a transversal dimension of medicine that focuses on the impact of gender on human physiology, pathophysiology, and clinical features of diseases.

According to this perspective, gender influences the prevalence and clinical features of disorders, treatment responses as well as health and subjective well-being. To date, many aspects of male and female differences still remain to be explored.

For this Special Issue of IJERPH, we seek research papers on various aspects of gender differences in emotions, cognition, and behavior. In particular, we encourage the submission of interdisciplinary work and multi-country collaborative research.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
