Public Health and Implementation Research for HIV Prevention Interventions

Message from the Guest Editor

The ultimate goal of HIV prevention is to eliminate HIV transmission and end the AIDS epidemic as a public health threat by reducing new HIV infections, AIDS-related deaths, and ensuring the sustainability of the HIV response. Public health and implementation research plays crucial roles in HIV prevention by identifying effective interventions and strategies to scale them up and ensure they reach the populations most affected by the epidemic. We are seeking research that focuses on bridging the gap between research findings and real-world application, addressing factors that affect intervention delivery and uptake. This includes public health and implementation research that identifies and evaluates various HIV prevention interventions, including biomedical approaches like PrEP and male circumcision, behavioural strategies like condom promotion and patient navigation, and structural interventions that address social and environmental factors.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
