

Special Issue

HIV Prevalence and Risk Factors in Populations Experiencing Marginalization

Message from the Guest Editor

HIV continues to disproportionately impact populations facing marginalization in society. As the U.S. and other countries move steadily toward zero new infections, the epidemiology of HIV reveals that those who remain at high risk of HIV are those who face additional epidemics related to stigma and discrimination. This Special Issue focuses on the current state of knowledge on the links between marginalization and HIV. New research papers tackling a rigorous examination of this link, using new measures and methods to do so, are welcome to this Issue. Papers examining multi-level interventions that address stigma and discrimination are also welcome. Intervention and social epidemiological papers are requested from low- and middle-income countries as well as high-income countries. Other manuscript types accepted include methodological papers and commentaries specifying new policy directions for HIV research with populations facing marginalization.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
