Assessment of Health-Related Quality of Life (HRQoL) in Public Health

Message from the Guest Editors

At present, it can be considered that the health-related quality of life (HRQoL) is a useful tool for measuring the impact that a disease has on the physical and mental aspects of an individual and to evaluate the efficacy/effectiveness of a treatment or health intervention. The trends of incidence in chronic diseases, the aging of the population, and the improvement of the treatments mean that the HRQoL has important repercussions on public health. The issue is open to all researchers or research groups that analyze HRQoL, including papers related to methodological aspects of validation of general or specific HRQoL questionnaires, systematic reviews or original articles that evaluate this problem both in the general population and in a specific disease.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
