Hospital Supply Chain System: Green Supply Chain Management in the Healthcare System

Message from the Guest Editor

The healthcare system's green supply chain management (GSCM) goes beyond traditional supply chain management based on traditional physical flows and other flows, such as patients' waiting time, the use of medical resources, etc. A good framework of GSCM in the healthcare system will incorporate internal and external units' activities and operations in increasing sustainable competitive advantages. Further, GSCM can facilitate information sharing and information exchange in environmental problems and continuous material flow in the healthcare process. Hence, the healthcare system with GSCM can reinforce the resources and activities to meet individual and public health needs. Badi and Murtagh (2019) conducted a systematic literature review on the exploration of GSCM and suggested the trend for future research. The editors encourage researchers who are interested in the Special Issue to thorough review the paper. We welcome researchers to contribute their knowledge and research results in the Special Issue.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
