Implant-Prosthetic Rehabilitation and Maintenance

Message from the Guest Editor

Today, oral implantology is one of the most successful dental branches, involving an ever-increasing number of patients with very good and predictable results in most clinical situations. However, still today, peri-implantitis is a major and growing problem, despite the various maintenance protocols proposed in the literature. At the same time, there is a growing need for implant prosthetic rehabilitation in patients who are affected by general pathologies, sometimes in poor general health conditions, or in old age. The objective of this Special Issue is to provide an update of the current knowledge in implant maintenance protocols also in the light of the management of peri-implantitis. It is also intended to focus on the management and rehabilitation of patients in old age, patients suffering from systemic diseases, or who take particular drugs (such as anticoagulants). At the same time, it aims to show the most recent technological achievements in the world of implant-prosthetic rehabilitation, in order to obtain results with better reproducibility, predictability and success rate.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
