Burden of Cancer Worldwide

Message from the Guest Editors

Neoplasms have a high burden worldwide, with differences in incidence and mortality rates between countries. Cancers associated with infectious agents have a high incidence and mortality in low- and middle-income countries. On the other hand, in high-income countries, there is a greater burden of cancers associated with changes in reproductive behavior, the Westernization of habits, and lifestyle, a phenomenon classified as cancer transition. Inequalities in cancer survival between countries are also noteworthy due to better access to early diagnosis, timely treatment, and high-cost therapeutic innovations in high-income countries. These inequities are also observed at the subnational level, reflecting differences in the demographic and epidemiological transition process and inequalities in access to health services. This Special Issue, "Burden of Cancer Worldwide," seeks to explore differences in incidence, mortality, survival, access to cancer care, exposure to risk, and protective factors (individual, environmental, and contextual) across countries and at the subnational level.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
