

Special Issue

Low-Carbon Development and Carbon Reduction

Message from the Guest Editors

Since the Industrial Revolution, global greenhouse gas emissions led by carbon dioxide have increased sharply. Global warming caused by increasing concentrations of greenhouse gases is changing the pattern of natural disasters by influencing the intensity and frequency of extreme weather or climate extremes, and further affecting global food production, human life, and the natural environment. Therefore, we need global actions to rationally promote carbon emission reduction and build a low-carbon world together. All of these have induced new demands on the development approach and created the need to initiate more comprehensive and in-depth research. This Special Issue aims to provide a platform for researchers, policy makers, entrepreneurs, and the public to access advanced resources on low carbon development and carbon reduction. You are welcome to conduct research on carbon reduction at macro and micro levels from a theoretical or practical perspective.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
