Maternal Health and Pregnancy Complications

Message from the Guest Editors

Poor maternal health and birth outcomes can be found worldwide, and improving the health of mothers and babies is an important public health priority. Cardiovascular disease constitutes nearly 30% of pregnancy-related deaths. Preeclampsia, a hypertensive pregnancy diagnosed before 20 weeks' gestation, may result in significant maternal, fetal, and neonatal morbidity and mortality. Researchers and practitioners in the field are constantly searching for advances in the prevention, care, and diagnosis of pregnancy disorders. Developing strategies for reducing the risk factors which predispose the population to these complications, and for reducing the acute and long-term complications, are crucial to decreasing the full impact of the condition. A Special Issue of *IJERPH* is being organized to present a collection of innovative, high-quality research studies focused on pregnancy health and its impact on fetoplacental growth. We cordially invite authors to submit qualitative and quantitative studies and reviews addressing original research and case studies that fill in the current knowledge gaps or conduct in-depth analysis of the present state of knowledge.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
