Neuro-Immune Interactions in Autism Spectrum Disorders

Message from the Guest Editors

Maternal immune activation and early life infections are factors that can increase risk of autism and related developmental disorders. Given this, it follows that treatments which modulate the immune response, either systemically or in the brain, may hold promise for management or amelioration of autism symptoms. This Special Issue on neuro-immune interactions in autism seeks to provide a timely update on both fronts and seeks research contributions of both pre-clinical and clinical findings, as well as reviews on specific topics within this scope.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
