New Directions for Energy Policy

Message from the Guest Editors

Climate change, resource crisis, and environmental pollution are demanding new directions for energy policy. In many countries around the world, there is a shift from traditional fossil fuels to renewable energies. In the technical aspect, it is necessary to upgrade the various technologies for new energy, which leads to an increase in technological demand for more efficient and smarter energy system development. On the economic side, it calls for changes in new price policies based on the supply and demand principles in an energy market. On the social side, it calls for changes in the behavior of individuals, consumers of energy. From a political point of view, it demands an ideological basis for supporting eco-friendly energy sources. On the policy side, there is a need for changes in laws and regulations for new energy systems that go beyond the present interest, investment costs, and path dependence. This issue deals with various research theoretical and practical topics about social, economic, political, and policy dimensions of a new direction for energy.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
