Novel Insights of the Etiological Factors Involved in Oral Conditions of Children and Teenagers

Message from the Guest Editor

There are a number of problems that affect the oral health of children and teenagers worldwide. Some dental and oral diseases are common chronic diseases of childhood (such as dental caries, which is one of the most common chronic diseases of childhood in the world). Other oral health conditions are rare in the general population but may lead to problems with eating, speaking, playing, and learning. Children with special healthcare needs are also more affected by some oral diseases and conditions, especially developmental dental alterations. In recent decades, more studies in this vast area have been performed, including epidemiological studies as well as basic experimental research. However, more studies are necessary before oral health aspects can be fully integrated into health promotion policies. This Special Issue of the International Journal of Environmental Research and Public Health (IJERPH) focuses on the current state of knowledge of the etiological factors involved in different oral conditions in children and teenagers. Original research papers, systematic reviews, and meta-analyses are welcome to this issue. We will accept manuscripts from different disciplines.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
